

AWS EC2 Ubuntu 24: Direct Root SSH Configuration Guide

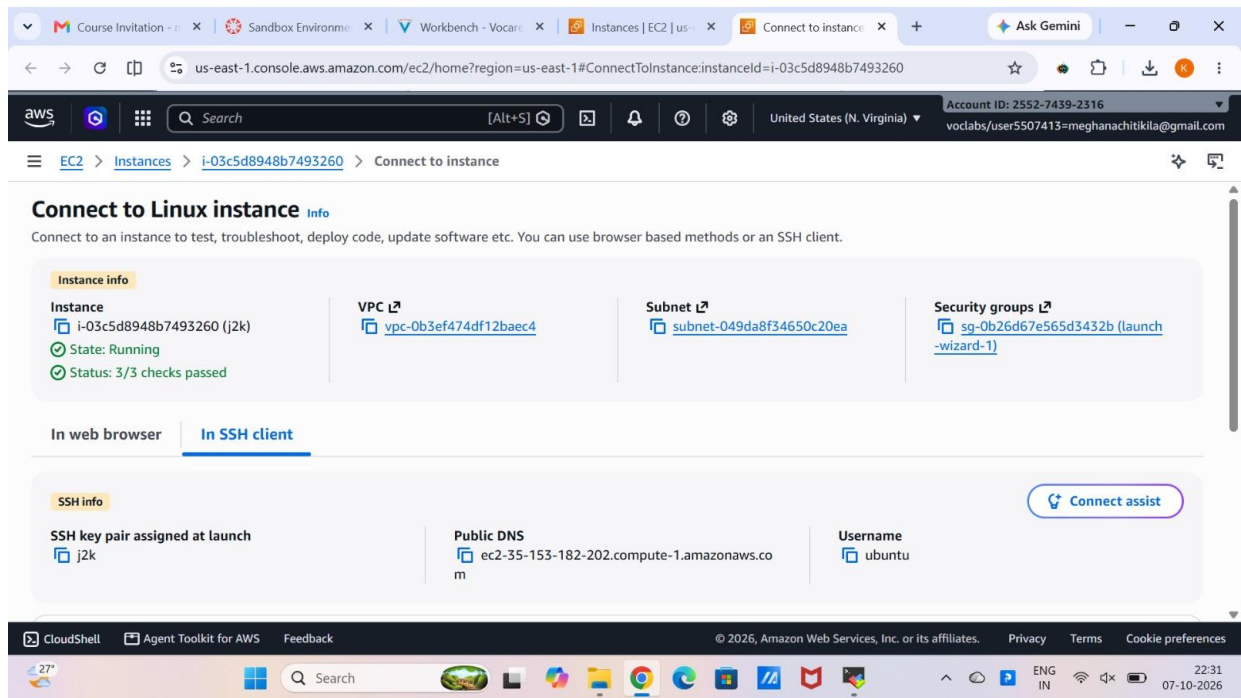

A step-by-step documentation on setting up an Ubuntu EC2 instance on AWS and enabling direct SSH login for the `root` user with password authentication.

1. Launch & Identify Instance

- * Launch an Ubuntu 24.04 instance on AWS EC2.
- * Note down the instance's Public IPv4 address and ensure SSH (Port 22) is open in the attached Security Group.

[EC2 Instance]

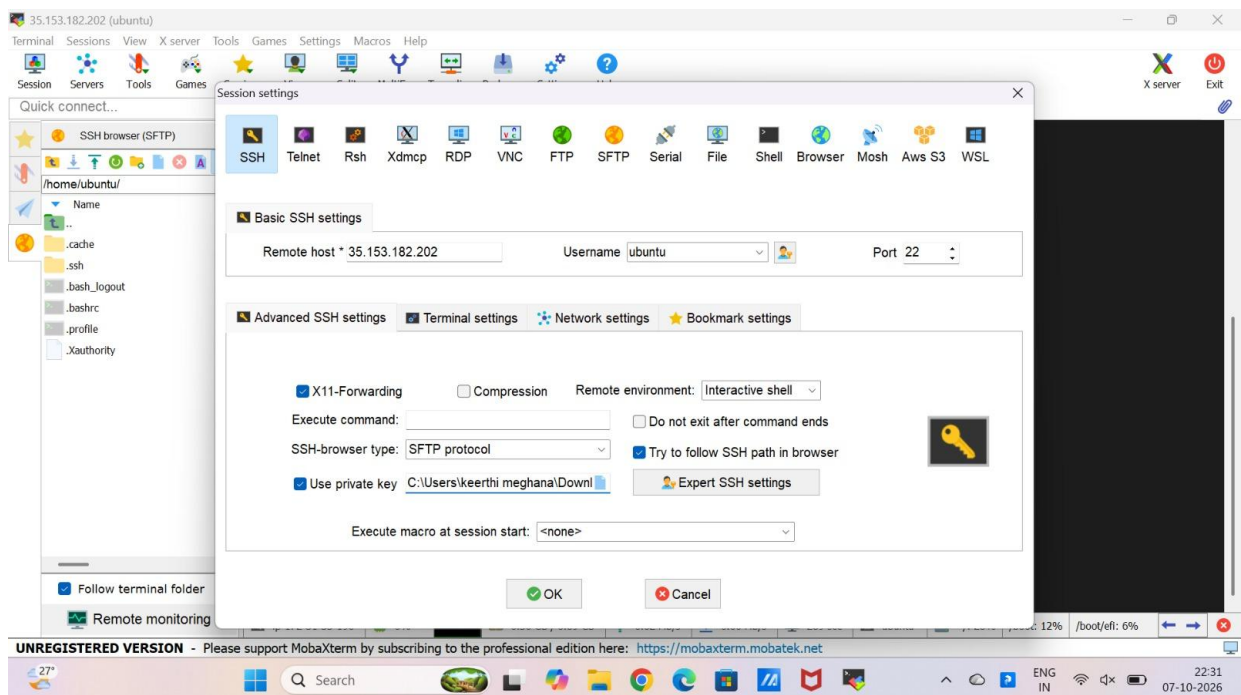

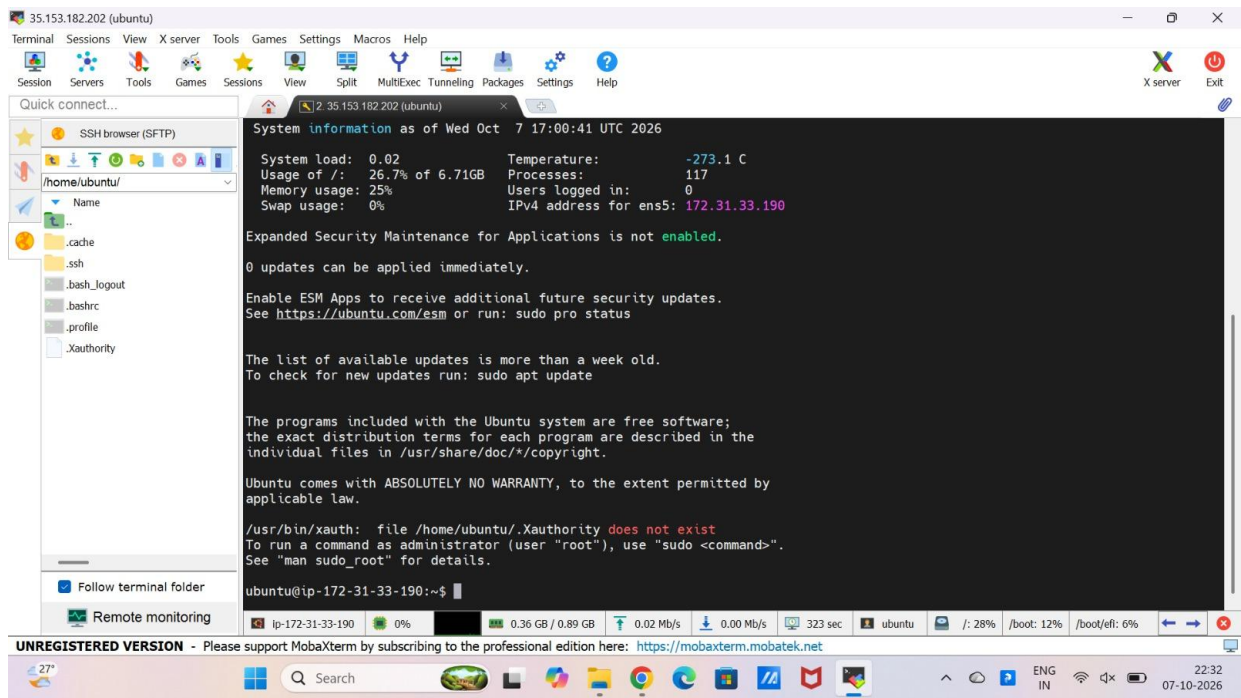

2. Initial SSH Connection via MobaXterm

- .Open MobaXterm and create a new SSH session

- .Use default username `ubuntu` and attach your downloaded `.pem` key under Advanced SSH settings

* Successfully access the terminal.

3. Set Root Password

Switch to root and set a strong password:

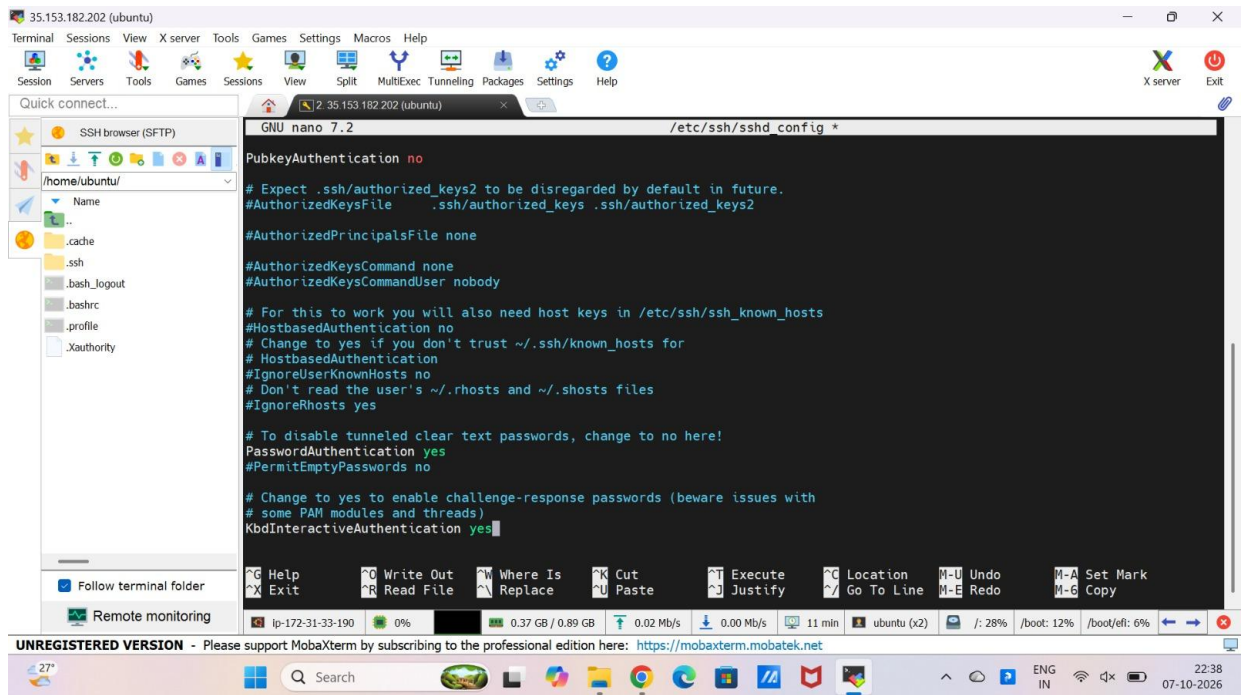

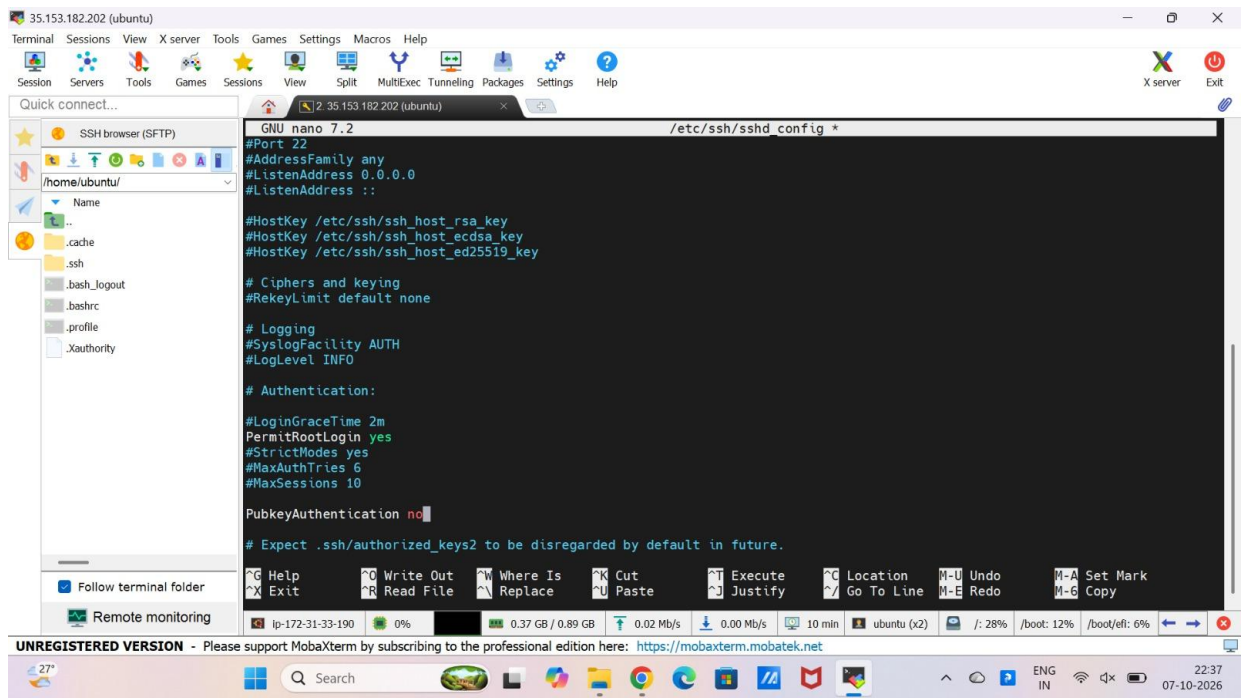

```
```bash
sudo su -
passwd root
```
```

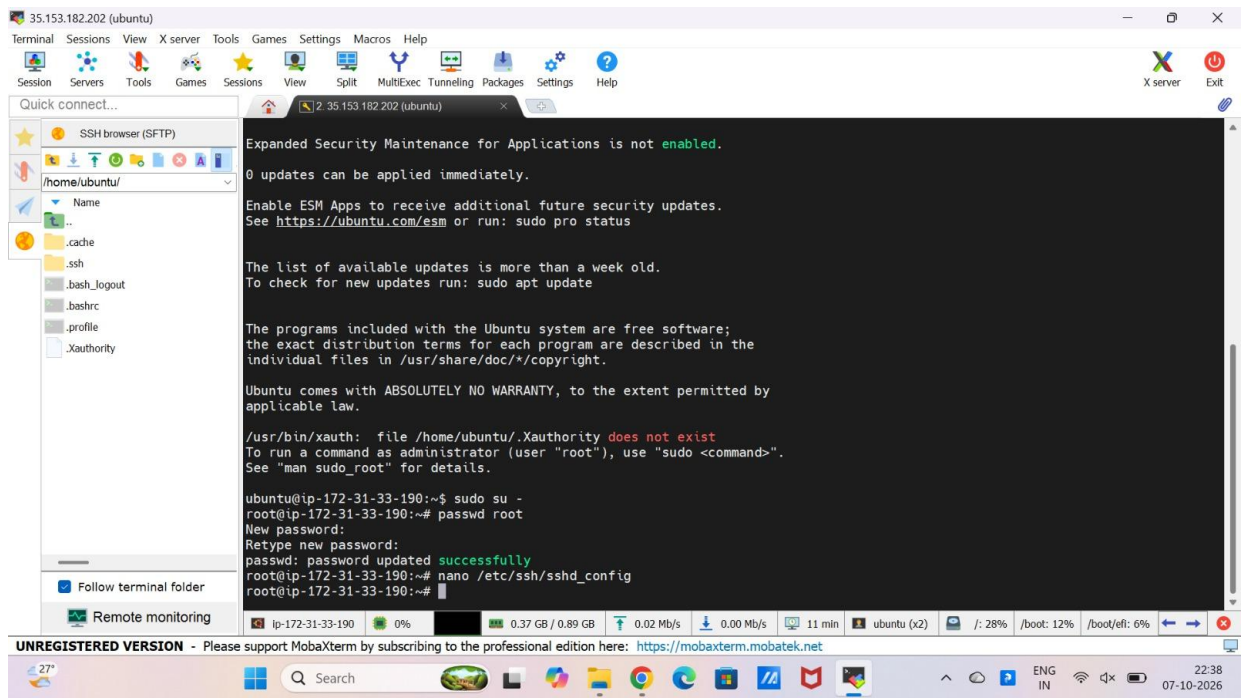

4. Modify SSH Daemon Configuration

Edit the SSH server configuration

```
```bash
nano /etc/ssh/sshd_config
```
```

```
text
PermitRootLogin yes
PubkeyAuthentication no
PasswordAuthentication yes
KbdInteractiveAuthentication yes
```

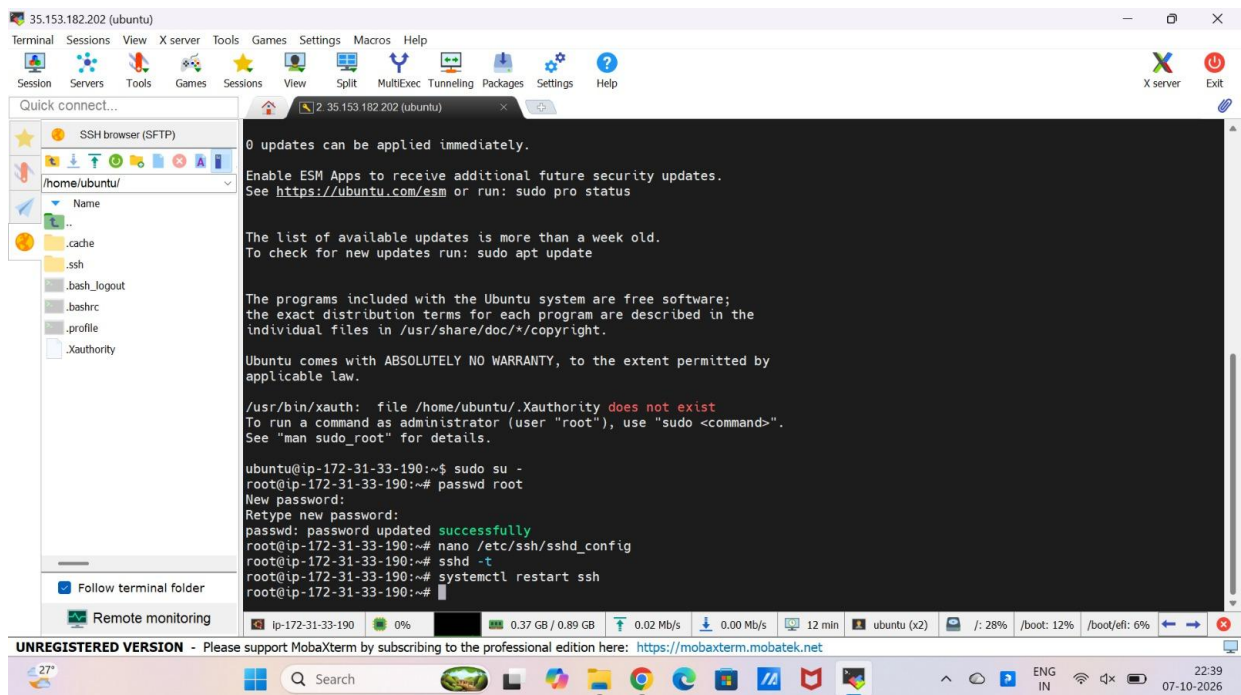

5. Validate & Restart SSH Service

Check the syntax and reload the SSH

```
bash
sshd -t
systemctl restart ssh
```

6. Connect Directly as Root

- * Create a new session in MobaXterm with Remote Host set to your Public IP and username set to `root`.
- * Authenticate using the password configured in Step 3.
